

DeFi yield, by intent.

The conversational copilot for multi-chain yield.

An AI chatbot that turns a single risk preference into the best stablecoin, LP, and single-asset strategies across Solana, Monad, Base, and Sui — ranked by APY, TVL, and risk.

\$170B+ locked. \$6.5B traded daily. Still nowhere to start.

\$170B+

Total DeFi TVL

Across all chains and protocols · Mar 2026

\$6.5B

DEX daily trading volume

Aggregated across 1,100+ decentralized exchanges · Apr 2026

+37%

DEX volume growth in 2025

Top-10 DEXs: \$876B in Q2 2025, up 25% QoQ

WHERE AEGIS PLAYS

The fast-growing L1/L2s where the next yield wave lands first.

SOLANA

\$2.65B daily DEX vol

BASE

Top EVM L2 by TVL growth

MONAD

New high-throughput L1

SUI

Fastest-growing Move chain

DeFi has the yields. It just hides them.

PROBLEM

Users juggle a dozen dashboards to find real yield.

- **Fragmented**
Yields live in 100+ protocols across chains. No one view.
- **Opaque risk**
APY is shown; the risk you take to earn it is not.
- **Decision fatigue**
Users default to top-of-list pools — often worst-adjusted.

SOLUTION

One question. Optimal strategy, ranked and ready to execute.

- **Intent-first**
User states a goal — "hold stable" or "long BTC" — not a protocol.
- **Risk-scored**
Every pool gets a 0–2 Risk Point from protocol TVL + pool size.
- **Multi-chain**
Solana · Monad · Base · Sui, deduped and live from DeFiLlama.

One conversation. Three branches. A ranked strategy.

STEP 01

"What asset do you want to hold?"

BRANCH A

Stable Asset

USDC · USDT · DAI · USDS · PYUSD

WE RECOMMEND

Top stablecoin strategies

Ranked by APY × TVL × Risk Point across all 4 chains.

BRANCH B1

Volatile · Partial

BTC · ETH · SOL · MON · SUI

WE RECOMMEND

LP pools (asset + stable)

Earn yield while keeping partial stablecoin exposure.

BRANCH B2

Volatile · Full

Maximum exposure

WE RECOMMEND

Lending · staking · single-sided

Maximize return on a fully held volatile position.

Live data. Real risk math. Ready to ship.

4

Chains live today

Solana · Monad · Base · Sui

\$1M+

Min TVL per pool

Filters out illiquid noise and dust pools

0–2

Risk Point per pool

Combines protocol rank + TVL quartile

THE STACK

DeFiLlama → Python pipeline (dedupe + categorize + risk score)
→ Conversational LLM front-end → one-click execute.

WHAT WE'RE BUILDING NEXT

Auto-routed execution + portfolio monitor

Live APY, invested TVL, and risk score for every active position —
rebalanced as the market moves.

How every pool earns its 0–2.

A purely on-chain, math-only filter. No LLM. Runs in milliseconds across every chain we cover.

FORMULA

$$\text{Risk Point} = (\text{Protocol Pts} + \text{TVL Quartile Pts}) \div 100$$

INPUT A

Protocol Points · 0–100

Rank each protocol by TVL within its chain.

Top protocol = 100, then step down by $100 \div n$.

INPUT B

TVL Quartile Points · 0–100

Where the pool ranks across the entire filtered universe by TVL.

Pre-filter: TVL > \$1M

Final range · 0.25 → 2.00 (higher = safer)

Five pillars. 80 points. One kill switch.

Every protocol is scored 0–100 across five weighted dimensions before any deposit is allowed.

From landing to executed strategy.

Four revenue streams. One pipeline.

Every recommendation is a billable event — and the data behind it is itself a product.

01

x402 micropayments

Pay-per-call, settled on-chain.

Every chatbot query that returns a ranked strategy is gated by HTTP 402 — sub-cent fees, no accounts, no friction.

02

Agent pay-per-use

Aegis as a yield-decision API for other AI agents.

Wallet agents, trading bots, and portfolio copilots call Aegis per recommendation and pay per response.

03

Terminal AI

AI agent integration

Terminal for AI agent to pay for call data or pay for API without API keys

04

Data pipeline licensing

Sell the dataset behind the answers.

Deduped, risk-scored, multi-chain yield data — licensed to DeFi dashboards, fund managers, and analytics platforms.

The stack we ship on.

Two live APIs. No AWS. No vendor lock-in. Buildable in 24 hours by a team of two.

BACKEND

Python · Minimax

FastAPI – API server + x402 middleware

httpx – async DeFiLlama fetcher

AI – Minimax integration

FRONTEND

Next.js · Tailwind

Next.js 14 – Application framework

Tailwind CSS – Utility-first styling

viem – Lightweight wallet interactions

recharts – 5-Pillar radar visualisation

BLOCKCHAIN

ERC-4337 + x402 on EVM

x402 facilitator – Coinbase-hosted payment verify

USDC – Primary settlement currency

Solana, Base, Monad, Sui – integrated network

DATA

Two sources. That's it.

yields.llama.fi/pools

The primary data hub for DeFi yield tracking, risk metrics, and historical performance across all major chains.

And that's the pitch.

Thank you.

Questions, feedback, or just want to try it — let's talk.
